Notes

Analysis

- Figure out what should be done (requirements/specifications)
 - What are the possible problems that need to be solved?
 - What is your current understanding of those problems?
 - What is the process that you must go through to solve these problems?
 - Are there any edge cases that must be considered / are there any constraints that must be acknowledged?

Notes

Software Development Process

- Analysis
- Design**
- Implementation
- Repeat

References

Notes

Design

- ▶ Create an overall structure for the system
 - ▶ How does the program flow?
 - ▶ Which parts should the system have?
 - ▶ How should those parts communicate?
 - ▶ Can any libraries help you solve the problem?

Notes

Design

- ▶ Focused on problem solving, *not* on implementation/coding details
- ▶ Documentation of the design should be language agnostic
- ▶ In this course, we will capture design details using
 - ▶ Flowcharts
 - ▶ Pseudocode

Notes

Implementation

- ▶ Consists of three stages
 - ▶ Writing code
 - ▶ Debugging the code that we've written
 - ▶ Testing the code to ensure that it actually does what it is supposed to do

Notes

Repeat

- ▶ When we start a program, we rarely know the problem(s) well
 - ▶ We frequently think that we do, but often we don't
- ▶ Only a combination of thinking about the problem (analysis) and experimentation (design and implementation) give us the solid understanding that we need to write good programs

Notes

Repeat

- We frequently build a small, limited version of our programs first
 - This helps bring out problems in our understanding, ideas, and tools
 - It also helps us see if details of the problem statement need changing to make the problem manageable
 - It is rare to find that we had anticipated everything when we analyzed the problem and made the initial design
 - So we frequently have multiple iterations through the analysis, design, and implementation steps
