# Overview

## Output formats

### Formatting output

- Integer output

- Floating-point output

  - default float format

  - scientific format

  - fixed format

### Output fields

- Field width

- Field fill

- Field adjustment

### Line-oriented input

- Type vs. line

- Mixing formatted input with line-oriented input - be careful

- Prefer formatted input

### Character-oriented input

- Character classification functions

### References

# Observation

- ▶ As programmers we prefer `regularity` and `simplicity`

# Observation

- ▶ As programmers we prefer **regularity** and **simplicity**
  - ▶ But, our job is to meet people's expectations

# Observation

- ▶ As programmers we prefer **regularity** and **simplicity**
  - ▶ But, our job is to meet people's expectations
- ▶ People are very fussy/particular/picky about the way their output looks

# Observation

- ▶ As programmers we prefer **regularity** and **simplicity**
  - ▶ But, our job is to meet people's expectations
- ▶ People are very fussy/particular/picky about the way their output looks
  - ▶ They often have good reasons to be

# Observation

- ▶ As programmers we prefer **regularity** and **simplicity**
  - ▶ But, our job is to meet people's expectations
- ▶ People are very fussy/particular/picky about the way their output looks
  - ▶ They often have good reasons to be
  - ▶ Convention/tradition rules

# Observation

## References

# Formatting output

- ▶ Output formatting is controlled by a set of flags and integer values for a given stream
  - ▶ Integral output
  - ▶ Floating-point output
  - ▶ Output fields
  - ▶ Field adjustment
- ▶ Manipulators
  - ▶ Manipulators allow us to manipulate the state of a stream; they are inserted between the objects being read or written
  - ▶ Most manipulators are *sticky* : they are set and permanent until changed

```
#include<iomanip>
```

# Floating-point output

- ▶ Floating-point output formatting is controlled by its `format` and `precision`
- ▶ The floating-point value being output is rounded to give the best approximation that can be printed given the specified `precision` in the chosen `format`
- ▶ The default `precision` is six digits

# Type vs. line

- Read a string:

```
string name;  
cin >> name;  
// input: Bjarne Stroustrup  
cout << name << endl;  
// output: Bjarne
```

- Read a line:

```
string name;  
getline(cin,name);  
// input: Bjarne Stroustrup  
cout << name << endl;  
// output: Bjarne Stroustrup  
/* now what? */  
/* maybe... */  
istringstream ss(name);  
ss >> first_name;  
ss >> second_name;
```

# Mixing formatted input with line-oriented input - be careful

```
int yob; string name;  
cin >> yob;  
// input: 1950  
getline(cin,name);  
cout << yob << '\t' << name << endl;  
Output: 1950
```

# Mixing formatted input with line-oriented input - be careful

```
int yob; string name;  
cin >> yob;  
// input: 1950  
getline(cin,name);  
cout << yob << '\t' << name << endl;  
Output: 1950
```

- (cin) reads formatted input and delimits on white-spaces

# Mixing formatted input with line-oriented input - be careful

```
int yob; string name;  
cin >> yob;  
// input: 1950  
getline(cin,name);  
cout << yob << '\t' << name << endl;  
Output: 1950
```

- ▶ (cin) reads formatted input and delimits on white-spaces
- ▶ This means that there is still a linefeed left-over in the input buffer from the character return when I entered 1950  
[Return]

## Mixing formatted input with line-oriented input - be careful

```
int yob; string name;  
cin >> yob;  
// input: 1950  
getline(cin,name);  
cout << yob << '\t' << name << endl;  
Output: 1950
```

- ▶ (cin) reads formatted input and delimits on white-spaces
- ▶ This means that there is still a linefeed left-over in the input buffer from the character return when I entered 1950  
[Return]
- ▶ It is that character return that is read by `getline(cin,name)`

# Mixing formatted input with line-oriented input - be careful

```
int yob; string name;  
cin >> yob;  
// input: 1950  
getline(cin,name);  
cout << yob << '\t' << name << endl;
```

Output: 1950

- ▶ (cin) reads formatted input and delimits on white-spaces
- ▶ This means that there is still a linefeed left-over in the input buffer from the character return when I entered 1950  
[Return]
- ▶ It is that character return that is read by `getline(cin,name)`
- ▶ Meaning that `getline` does not **block** for data from standard input

# Overview

- Output formats

- Formatting output

  - Integer output

  - Floating-point output

    - default float format

    - scientific format

    - fixed format

- Output fields

  - Field width

  - Field fill

  - Field adjustment

- Line-oriented input

  - Type vs. line

  - Mixing formatted input with line-oriented input - be careful

  - Prefer formatted input

- Character-oriented input

  - Character classification functions

- References

# Prefer formatted input

- ▶ Prefer formatted input `>>` to line-oriented input `getline()`
  - ▶ i.e. avoid line-oriented input when you can
- ▶ People often use `getline()` because they see no alternative
  - ▶ But it easily gets messy
  - ▶ When trying to use `getline()`, you often end up
    - ▶ using `>>` to parse the line from a `stringstream`
    - ▶ using `get()` to read individual characters

# Character-oriented input

- You can also read individual characters:

```
for (char ch; cin >> ch; )  
{  
    if (isalpha(ch)) {  
        // do something  
    }  
}
```

```
for (char ch; cin.get(ch); )  
{  
    characters  
    if (isspace(ch)) {  
        // do something  
    } else if (isalpha(ch)) {  
        // do something else  
    }  
}
```

# Character classification functions

- ▶ If you use character-oriented input, you often need one or more of these (from header `<cctype>`):
  - ▶ `isspace(c)`
    - ▶ is `c` whitespace (' ', '\t', '\n', etc.)?
  - ▶ `isalpha(c)`
    - ▶ is `c` a letter ('a'..'z', 'A'..'Z')? note: not '\_'
  - ▶ `isdigit(c)`
    - ▶ is `c` a decimal digit ('0'..'9')?
  - ▶ `isupper(c)`
    - ▶ is `c` an upper case letter ('A'..'Z')?
  - ▶ `islower(c)`
    - ▶ is `c` a lower case letter ('a'..'z')?
  - ▶ `isalnum(c)`
    - ▶ is `c` a letter or a decimal digit ('a'..'z', 'A'..'Z', '0'..'9')?
